

Pricing Page Conversion Research for ProjectCreation

Executive summary

The strongest findings from academic research, UX studies, and live SaaS pricing pages all point in the same direction: subscription pricing pages convert better when they reduce cognitive load, make the “best next choice” obvious, keep total cost and billing terms transparent, place credible proof close to the decision, and avoid manipulative urgency. Simpler price structures are generally preferred to more complex ones because complexity lowers perceived fairness and transparency; middle options often attract disproportionate choice; defaults materially shape decisions; reviews and verified proof raise confidence and conversion; and trust cues plus clear billing/cancellation terms reduce abandonment. ¹

For subscription businesses specifically, monthly plans usually help acquisition while annual plans improve cash flow, reduce churn pressure, and can lift LTV; current subscription-industry data suggests many merchants now offer both, use monthly as the low-risk on-ramp, and then push engaged users toward annual commitments. At the same time, trial strategy is not one-size-fits-all: app-subscription data shows longer trials can convert better than very short ones, while freemium versus hard paywall outcomes differ sharply by category and retention horizon. That means ProjectCreation should treat trial length, annual emphasis, and free-entry mechanics as testable levers rather than ideology. ²

ProjectCreation’s current pricing page has real strengths: it is visually distinctive, strongly on-brand, clearly three-tiered, and already signals a recommended middle plan, annual savings, and a no-card trial. But the current page also creates avoidable friction. The biggest issues are not aesthetic; they are clarity and trust issues. The page does not explain the product suite in plain English quickly enough, it repeats the same choice architecture across several sections, it uses jargon before meaning is established, it contains at least one serious trust hazard in the visible “Uptime 94%” treatment, and the live site currently presents a direct inconsistency: the homepage describes ProjectBuilt as “Upcoming,” while the pricing page sells ProjectBuilt Mini and Full as active plan inclusions. Those issues are likely more conversion-relevant than any small styling tweak. ³

The highest-confidence recommendation is therefore not to redesign the page away from its builder identity, but to **preserve the terminal/technical aesthetic while making the commercial decision path much more legible**. In practice, that means: explain what ProjectCreation actually includes above the fold; move billing choice and total-cost framing into the first decision moment; reduce duplicate sections; translate internal product jargon into outcome language; add proof and trust near CTAs; and treat “popular” and urgency claims as data-backed claims only, not decoration. Pure decoys are less reliable in real markets than straightforward compromise framing and recommended-plan emphasis, so the page should optimize for a clearly justified Pro plan rather than a clever pricing trick. ⁴

What the evidence says

Pricing psychology and choice architecture

A repeated finding in pricing research is that **simpler prices and simpler price plans outperform more complex ones when buyers are uncertain**. Homburg, Totzek, and Krämer found that perceived price complexity hurts fairness and transparency perceptions and can push customers toward simpler alternatives even when the complex option is objectively cheaper. For pricing pages, the implication is direct: tiers should differ on a few meaningful, intelligible dimensions, and the user should not need to decode capacity language before understanding value. ⁵

Research on defaults and compromise effects matters just as much. Johnson and Goldstein's classic default-effect work showed that simply changing the default state can radically change decisions; the lesson for pricing pages is an inference, not a literal transplant, but a strong one: whichever billing cycle, plan, or CTA state appears "preselected," "recommended," or most visually privileged will usually absorb more choice share. Separate work on the compromise effect shows that people often prefer the intermediate option in a set, and Huber, Payne, and Puto's later commentary argues that while strict asymmetric-dominance decoys are rarer in real marketplaces, compromise framing remains highly relevant in practice. For SaaS pages, that means the middle plan should usually be the most justified, best-labeled, and easiest to choose. ⁶

Anchoring and price framing are useful, but they work best when they stay credible. Comparative and reference pricing can increase perceived value, and discount-framing research shows presentation format matters: percentage framing can work especially well for lower-priced products and stronger discounts, while absolute savings often work better for higher-priced ones. ProjectCreation's prices are low enough that "25% off" is reasonable. But online pricing research and consumer-protection rules both point to the same warning: once you split price into monthly-equivalent, yearly total, add-ons, usage, or discounts, you still need the actual total cost to remain easy to see and hard to misunderstand. ⁷

Choice overload is real, but not automatic. Meta-analytic work suggests large assortments do not always reduce conversion; overload becomes more likely when people are preference-uncertain, the differences are hard to justify, or the set is difficult to compare. The design implication is that **three plans is not inherently too many**; three plans with repeated jargon, overlapping claims, and multiple comparison modules can be. Progressive disclosure works well here: show the decision first, expose the full spec sheet only when people want it. ⁸

Social proof, urgency, and trust

The most reliable social-proof finding is not "add logos somewhere." It is "add credible proof that reduces perceived risk at the moment of decision." Spiegel Research Center's work found that displaying reviews can materially increase conversion, that early reviews matter disproportionately, and that verified-buyer cues improve credibility and purchase odds. Industry evidence from Mutiny/UserEvidence also points in the same direction: qualitative testimonials near the decision can outperform logo walls alone. In practice, this means a pricing page for a technical product should favor **outcome proof** over decorative branding: one quantified testimonial, one credible "trusted by" strip, or one concise performance proof block is usually worth more than a generic logo band by itself. ⁹

Urgency is more delicate. Competition regulators and recent academic work both warn that deceptive scarcity cues and fake countdowns can create reactance, reduce perceived benevolence, and cross into dark-pattern territory. The UK CMA has explicitly warned that misleading countdown clocks and scarcity claims can pressure consumers unfairly, and the FTC has emphasized that dark patterns that manipulate subscription purchase decisions or bury material terms are enforcement risks. Genuine scarcity can help if it is true; artificial urgency is a conversion debt that is repaid later in distrust. For ProjectCreation, “three days free” is fine if it is literal; “most popular,” “launch priority,” or any future scarcity language should only be used if it is objectively defensible. ¹⁰

Trust signals remain underused on many SaaS pricing pages. Baymard reports that a meaningful share of users abandon checkout because they do not trust the site with payment information, and their testing shows that users’ sense of security is driven heavily by visual and contextual cues such as reassuring microcopy, a more “robust” presentation around payment, and obvious disclosure of terms. The broader transparency point is equally important: users abandon when they cannot see the total cost early enough, when the process feels too long, or when cancellation/account rules are unclear. That is directly relevant for subscription pricing pages even before checkout begins. ¹¹

Subscription-specific implications

Annual versus monthly is not merely a billing toggle; it is a business model lever. Paddle’s analysis argues that introducing annual plans can reduce churn and that a 15–20% discount is common, while Recurly’s 2026 subscription data says 78% of merchants offer both monthly and annual and frames monthly as the lower-risk acquisition path with annual upsell improving lifetime value. That suggests a good pricing page should present both clearly, but not necessarily default every new visitor into the higher-commitment choice. Which default wins depends on your traffic quality, brand maturity, and time-to-value. ¹²

Trial design should also be handled experimentally. RevenueCat’s 2026 report on subscription apps found that trials of 17+ days converted much better than short trials, while hard paywalls converted substantially better than freemium on initial conversion but not on one-year retention; Recurly’s 2026 reporting also shows traditional trial conversion has weakened in some subscription categories while micro-subscriptions can qualify intent better. Those are not SaaS-universal rules, but they do strongly suggest that ProjectCreation should test its current 3-day no-card trial against at least one less compressed alternative or an alternative low-friction entry offer. ¹³

Practical findings translated into pricing-page decisions

Principle	What usually increases conversion	What to avoid	Why it matters for ProjectCreation
Simplicity	Fewer decision dimensions, clearer plan deltas, plain-English capability labels. ¹⁴	Dense jargon before value is understood.	Your voice can stay technical, but the commercial meaning must become immediate.

Principle	What usually increases conversion	What to avoid	Why it matters for ProjectCreation
Compromise framing	A clearly justified middle plan with stronger contrast and an honest “best fit” label. ¹⁵	Fake decoy tiers or unsupported “most popular” claims.	Pro is already positioned as the natural middle choice; make that explicit and credible.
Transparent pricing	Monthly equivalent + annual total + savings in one line near the primary CTA. ¹⁶	Burying total cost or making discount math feel slippery.	Your annual math is good, but it appears too late and in too many repeated places.
Proof near decision	Outcome statistic, short testimonial, known customer logos, trust microcopy. ¹⁷	Proof isolated far from CTAs.	The current page is almost entirely self-assertion; it needs external corroboration.
Genuine urgency	Real trial expiry or real launch priority with clear terms. ¹⁸	Resetting timers, vague scarcity, pressure language.	Builder audiences are unusually sensitive to hype that feels fake.
Subscription trust	No-card, clear cancelability, clear billing start, clear support/security path. ¹⁹	Ambiguous billing mechanics or low-confidence reliability signals.	The current “3 days free, no card required” is good; the visible “94% uptime” is not.

Live SaaS pricing-page patterns

I reviewed the live official pricing pages below because they are especially relevant to builder/technical audiences or to SaaS pricing UX more broadly. The links are official live pages, cited inline.

Example	What it does well	Why it likely converts	Live page
Linear	Simple four-tier ladder, annual billing indication on paid tiers, trusted-by count, large feature matrix.	Clear progression with minimal ornamental copy; strong for comparison-oriented technical buyers.	²⁰
Vercel	Sharp headline, free-to-Pro progression, visible spend-control framing, usage credits, free trial CTA on Pro, enterprise add-ons.	It reduces fear of usage pricing by saying “control your costs” and “set your own spend limits” before asking for commitment.	²¹
Netlify	“Build free. Scale when you need it,” cost calculator, full comparison, FAQ, credit system explained in detail.	Strong for technical users because variable usage is explained rather than hidden.	²²

Example	What it does well	Why it likely converts	Live page
Render	Simple workspace tiers plus separate compute pricing, explicit governance/security ladder, clear enterprise path.	Clean division between seat/workspace value and metered compute avoids pricing ambiguity.	23
Sentry	Developer-to-enterprise segmentation, monthly/annual toggle, “save with annual,” trial CTAs, closer-look comparison.	Good example of self-serve monitoring SaaS that serves both solo devs and larger teams without collapsing clarity.	24
GitHub Copilot	Separate individual/business framing, no-card free entry, clear credit allowances, platform availability, tier-specific upgrade CTAs.	Strong because it lowers entry friction while still anchoring higher-value paid tiers with explicit included credits.	25
Cursor	Very short pricing surface, free hobby entry with no credit card, immediate Pro CTA, technical feature language.	It works because the decision is fast; nothing blocks the “download and start” motion.	26
Replit	Monthly/yearly toggle, annual discount callout, explicit collaborator/agent limits, clear enterprise upgrades.	Excellent example of translating AI-resource limits into buyer-meaningful numbers.	27
Notion	Trusted-by logos above fold, monthly/yearly toggle with visible savings, business plan marked recommended, strong copy.	It sells a category-level promise first, then pricing; the recommendation label feels earned rather than forced.	28
Figma	Plan + seat-type model, “why choose” framing, annual option, free viewers/collab-style access, strong enterprise path.	Very effective for products where not every user has the same role; buyers can map seats to reality quickly.	29
Slack	Brand logos, personalized “find the right plan” quiz, strong CTA repetition, category-specific recommendation logic.	Slack reduces choice paralysis by turning pricing into guided diagnosis, not just a grid.	30
Jira	Team-size control, monthly/annual toggle, clear free tier, free trial CTAs, recommended premium tier.	It personalizes the price context immediately and helps buyers estimate fit without leaving the page.	31
Webflow	Persona tabs, separate workspace/site plans, trusted-by logos, multiple enterprise “talk to us” paths.	Powerful for complex products because it segments the page by user type and pricing object.	32

Example	What it does well	Why it likely converts	Live page
Framer	Site-plan pricing plus collaboration-seat economics, free viewers, add-ons, enterprise request-trial path.	Good example of progressive disclosure: simple entry grid, then detailed operational economics for serious evaluators.	33
Loom	Team-size input, monthly/annual toggle, free tier, clear feature scannability.	It keeps the page approachable by making the free path obvious and the upgrade logic incremental.	34

Across these examples, several repeatable patterns show up again and again: above-the-fold billing choice; obvious free or low-friction start; a visibly emphasized default plan; a secondary enterprise CTA; and a larger feature comparison section that lives below the initial decision surface rather than replacing it. Slack, Jira, and Webflow go further by helping users self-segment by team size, role, or use case before they ask for plan choice. Vercel, Netlify, Render, Replit, and Sentry are especially relevant for ProjectCreation because they show how technical products explain resource limits without sounding like internal engineering notes.

35

Conversion patterns and copy formulas

The most common high-performing SaaS pricing-page structure is a **two-layer architecture**. Layer one is for fast decision-makers: a short value proposition, billing toggle, 3–4 cards, obvious default plan, and immediate CTA. Layer two is for evaluators: a full comparison table, FAQs, trust details, proof, and enterprise pathway. That structure matches what pricing and UX research suggest: reduce visible complexity first, then offer detail on demand. 36

A second repeatable pattern is that the best pages make plan differences **semantic before numeric**. They do not start with raw limits; they start with who the plan is for and what level of work it unlocks. Linear uses “Free,” “Basic,” “Business,” “Enterprise” with straightforward capability progression. Vercel says “Start free. Upgrade to Pro.” Notion says “One tool to run your company.” This is important for builder products because technical users do care about specs, but they still decide through a question like “Will this fit how I work?” before they parse quotas. 37

A third pattern is that the best pages separate **decision microcopy** from **detail microcopy**. Decision microcopy is short and outcome-led. Detail microcopy is operational and comparative. ProjectCreation currently blends those layers too early; terms like “orchestrator,” “4t,” “Balanced + Accurate,” and “when live” appear before first-time buyers can map those concepts to outcomes. The fix is not to remove technical language, but to translate it in-place. 38

The formulas below are the most reusable for ProjectCreation’s brand voice:

Element	Recommended formula	Example adapted for ProjectCreation
Hero headline	Choose the plan for [job frequency / intensity].	Choose the plan for how often you build.

Element	Recommended formula	Example adapted for ProjectCreation
Hero subhead	[Product family] gives you [three core outcomes] in one subscription.	ProjectCreation gives you faster writing, clearer planning, and multi-terminal execution in one builder stack.
Plan label	For [persona] who need [capability threshold].	For solo builders who need real output headroom, not enterprise overhead.
Recommended badge	Best fit for [segment] or data-backed Chosen by [x]%	Best fit for most solo builders
Savings line	€X/mo billed annually (€Y today). Save Z% vs monthly.	€20/mo billed annually (€180 today). Save 25% vs monthly.
Trust microcopy	No card required. Cancel before billing. Taxes shown at checkout.	Start your 3-day Pro trial. No card. Cancel before billing.
Enterprise bridge	Need invoicing, team controls, or custom onboarding? Talk to us.	Need team billing, launch priority, or custom rollout? Talk to us.
Feature bullet	Verb + outcome + practical limit	Run 8 ProjectCipher terminals across 2 active workspaces.

The strongest UI patterns to pair with that copy are: a billing toggle above the cards; one visually dominant Pro card; 3–5 bullets per card max; a “see exact limits” expander below each card; one consolidated comparison matrix; proof and trust between the card section and the full comparison; a persistent anchor/sticky CTA on long scroll; and a clearly separate enterprise branch for visitors with team/compliance needs. Those patterns are consistent with the live pages above and with the evidence on complexity, trust, and social proof. ³⁹

Audit of the current ProjectCreation pricing page

The current pricing page is not weak; it is **under-translated**. Its brand system is memorable, the step-ladder logic is good, and the Pro plan is already positioned as the center of gravity. The page also does several commercially helpful things already: it shows annual totals and savings, it repeats CTAs, it creates a clear “Core → Pro → Max” progression, and it promises “Three days free. No card required.” Those are real strengths. ⁴⁰

The biggest problems are clarity, proof, and trust. First, the page tells users that there are “three different shapes of building,” but it does not immediately translate that into what the subscription actually contains. Second, it repeats the same decision in too many modules: the top card grid, the larger card grid, the “climb” section, the feature snapshot, and the final selector all restate the choice before new information is introduced. Third, the page contains a serious credibility issue: the homepage marks ProjectBuilt as “Upcoming,” while the pricing page sells ProjectBuilt Mini and Full as active features. Fourth, the visible “Uptime 94%” element on Max is damaging if taken literally, because enterprise pages in this category

typically emphasize SLAs, support, and security rather than low uptime numbers. Fifth, the page has almost no external proof or reassurance besides the no-card line. ⁴¹

Strengths

Current strength	Why it is good
Distinctive terminal aesthetic	Strong brand memory; helps ProjectCreation feel like a real builder product rather than generic SaaS.
Three-tier ladder	Fits compromise-choice behavior well and naturally points users toward Pro.
Pro emphasis	A middle-plan recommendation is usually the most practical choice architecture for self-serve SaaS. ¹⁵
Annual savings already present	Good foundation for annual framing without changing price points.
No-card, short trial	Excellent trust and friction reducer, assuming the trial experience is strong. ⁴²

Friction points and exact fixes

Issue	Why it hurts	Before	After
Hero is expressive but not explicit	Buyers still don't know what they are subscribing to.	"Three different shapes of building. Three tiers to match them."	Choose the plan for how you build. ProjectCreation combines ProjectWord, ProjectBuilt, and ProjectCipher into one builder subscription.
Product bundle is not explained above the fold	Technical users still need a fast mental model.	Product names appear without one-line definitions.	Add a single line under the hero: Write faster with ProjectWord. Turn ideas into plans with ProjectBuilt. Run multi-terminal workflows with ProjectCipher.
Unsupported popularity language	"Most popular" and "most builders land on Pro" should be true or softened.	"MOST POPULAR"; "Most builders land on Pro"	If unverified: Best fit for most solo builders. If verified: Chosen by 61% of paying builders. ⁴³
Homepage/ pricing contradiction on ProjectBuilt	This is a direct trust break.	Homepage: ProjectBuilt "Upcoming"; pricing: ProjectBuilt Mini/Full "ACTIVE"	Align both pages. If not live, say ProjectBuilt Mini beta access / ProjectBuilt Full early access with a release note. ⁴⁴

Issue	Why it hurts	Before	After
"Uptime 94%" on Max	If literal, it is alarming; if decorative, it is still misleading.	"Uptime 94%"	Replace with Priority execution, Higher throughput , or a real SLA only if supportable. Competitor enterprise tiers emphasize SLAs/support, not low uptime figures. ⁴⁵
Jargon appears before translation	Buyers cannot decode "4t," "orchestrator," or "Balanced + Accurate" instantly.	"ProjectCipher 8t · 2 workspaces · orchestrator 10/hr"	Run 8 ProjectCipher terminals across 2 active workspaces. Includes 10 orchestrated runs per hour.
Too many repeated comparison sections	Repetition increases scroll cost without adding meaning.	Top grid + second cards + climb + feature snapshot + selector	Keep one fast decision section, one proof/trust section, one full comparison section, one final CTA.
Billing choice appears too late	Users need to see monthly/annual in the first decision moment.	Billing toggle lower on the page	Move toggle above the first plan cards and show full annual total directly under each price.
CTAs are brand-consistent but not fully outcome-specific	"START PRO" is good; "trial" should be explicit at the first CTA.	"START PRO"	First CTA: Start Pro trial . Secondary/repeated CTA lower on page can remain START PRO .
Trust and purchase terms are buried	Subscription users want billing clarity before they click.	"One handshake. Three days free. No card required." near the bottom	Repeat under primary CTA: 3-day Pro trial. No card. Cancel before billing. Taxes shown at checkout.

Recommended structural rewrite

The current page should be compressed into this sequence:

Hero → Billing toggle → Three plan cards → Trust/proof strip → Progressive comparison → FAQ/trial terms → Final CTA

That keeps your identity intact while cutting the current decision path almost in half. In builder-language terms: the current page feels like five good components serially chained together; the next version should feel like one decisive interface with optional depth. That matches both the simpler-price evidence and the layout logic used by strong SaaS pages like Vercel, Linear, Notion, and Slack. ⁴⁶

Experimentation and measurement plan

The best next move is not a single redesign launch. It is a structured experiment program with one dominant hypothesis at a time. The table below assumes two-sided $\alpha = 0.05$, 80% power, and independent eligible sessions. Because you did not provide current funnel baselines, I use explicit assumptions; replace them with real values before launch.

Priority A/B tests

Priority	Test	Hypothesis	Primary metric	Baseline assumption	Expected effect	Approx. sample per variant	Effort
High	Hero clarity + product explainer	Stating what the bundle includes above the fold will raise plan-CTA clicks.	Pricing page → primary CTA click	4.0%	+15% relative	17,943	Low
High	Move billing toggle to hero + clearer cost line	Showing monthly/yearly choice and annual total at first decision point will increase annual-plan selection without hurting starts.	Annual billing chosen among plan selections	20.0%	+3 pp	2,943	Low
High	Replace “Most Popular” with justified recommendation	A credibility-safe recommendation label will increase Pro selection and reduce bounce from skeptical users.	Pro plan select share	35.0%	+4 pp	2,286	Low
High	Remove duplicate middle sections	A shorter decision path will increase CTA clicks and depth-to-start rate.	Pricing page → signup start	2.0%	+20% relative	21,109	Medium

Priority	Test	Hypothesis	Primary metric	Baseline assumption	Expected effect	Approx. sample per variant	Effort
Medium	Add proof strip near CTAs	One quantified testimonial + logo strip will increase CTA clicks and signup starts.	Pricing page → signup start	2.0%	+15% relative	36,693	Medium
Medium	Translate feature jargon to plain English	Translating limits into outcomes will raise comparison engagement and plan confidence.	Plan select after comparison interaction	10.0%	+1.5 pp	6,693	Medium
Medium	Trial framing test	"Start 3-day Pro trial" vs "Try ProjectCreation free for 3 days" will change signup rate and possibly paid conversion.	Signup start; paid conversion from signup	4.0%; 8.0%	+10–15% rel on start; +1.2 pp on paid	39,475 for start / 8,568 for paid	Low
Medium	Enterprise bridge CTA	Adding a small "Need teams, invoicing, or custom rollout?" branch will improve enterprise lead capture without hurting self-serve.	Contact-sales submit rate	0.8%	+20% relative	Use Bayesian/sequential due likely low volume	Low
Low	Trial length / entry model	A longer trial or a low-cost qualifying entry may improve paid conversion if aha-time exceeds 3 days.	Trial → paid	Unspecified	Unspecified	Requires actual funnel baseline	Medium

Priority	Test	Hypothesis	Primary metric	Baseline assumption	Expected effect	Approx. sample per variant	Effort
Low	Guided selector	A Slack-style “find your plan” helper may improve fit and reduce indecision for certain segments.	Plan-select rate; time to CTA	20.0%	+2 pp	6,510	Medium

The order matters. Start with **clarity, trust, and billing framing** before testing deeper mechanics like trial length. If the page is still confusing, later experiments will mostly measure confusion in new outfits rather than real lift. That prioritization follows the strongest evidence: simplicity, compromise framing, visible proof, and transparent terms generally move more than decorative changes. ⁴⁷

Recommended funnel and events

Track events at the level of the pricing decision, not just the signup completion. The minimum event schema should include the following:

Event	Key properties
pricing_page_view	variant, device, traffic_source, geo, logged_in, return_visitor
billing_toggle_changed	from_cycle, to_cycle, section, variant
plan_card_view	plan, section, position, billing_cycle, variant
plan_details_opened	plan, detail_type
comparison_interaction	plan_focus, feature_row, section
proof_interaction	proof_type, element_id
cta_clicked	plan, cta_location, billing_cycle, variant
signup_started	plan, billing_cycle, entry_point
trial_started	plan, trial_type, billing_cycle
payment_method_added	plan, billing_cycle

Event	Key properties
subscription_started	plan, billing_cycle, price_point
contact_sales_started / submitted	source_section, org_size_if_known
activation_event	define as first meaningful product-value moment, not just login

The dashboard stack should have three layers. First, a **pricing-page performance dashboard**: page views, CTA CTR, plan select rate, annual share, signup start rate, enterprise lead rate, segmented by device/source. Second, a **post-click funnel dashboard**: signup start → account create → trial start → activation → paid. Third, an **experiment dashboard**: lift, confidence, sample ratio mismatch checks, device split, source split, and guardrails like bounce rate and enterprise-contact cannibalization. Baymard's work is a good reminder here: if you only watch final purchase, you miss where trust, cost surprise, or complexity are doing damage.

48

Implementation roadmap and concept directions

Prioritized roadmap

Milestone	Scope	Effort	Required assets	Success metrics
Messaging and trust foundation	Rewrite hero, align homepage/pricing product states, remove/replace "94% uptime," surface trial/billing microcopy near top CTA.	Low-Medium	Copy, light design, engineering	+10–15% CTA CTR; lower bounce; zero product-status inconsistency
First-screen choice architecture	Move billing toggle above cards, clarify annual total, visually emphasize Pro, cap card bullets to 3–5, add enterprise bridge.	Medium	Copy, design, front-end	+2–4 pp annual share; +10% plan-select rate
Page compression	Remove duplicate comparison sections; keep one core comparison matrix and one final CTA.	Medium	UX design, front-end	+10–20% signup-start rate
Proof and reassurance	Add logo strip, one quantified testimonial, support/security/trial FAQ block, tax/cancellation clarity.	Medium	Customer proof, copy, design	+10–15% signup-start rate

Milestone	Scope	Effort	Required assets	Success metrics
Instrumentation	Implement events, dashboards, experiment framework, SRM alerting.	Medium	Analytics, engineering, data	95%+ event completeness; decision-ready experiment reporting
Monetization testing	Test trial framing, trial length/entry model, annual-default logic, guided selector.	Medium-High	Analytics, copy, design, engineering	Higher trial-to-paid, improved annual mix, better segment fit

Alternative wireframe concepts

These six concepts preserve the builder-focused ProjectCreation identity while changing the decision surface.

Concept	Description	Best use
Progressive disclosure shell	Hero + toggle + 3 cards; each card has one expanded "See exact limits" drawer; full matrix below only for evaluators.	Best all-around option for self-serve conversion
Simplified comparison	One hero, one three-card grid, one short proof strip, one compact "Core vs Pro vs Max" table, then final CTA.	Best for clarity and lower scroll fatigue
Storytelling flow	Page reads as "Start → Grow → Full capacity," but with each section introducing <i>new</i> information rather than repeating the same cards.	Best if you want to preserve the existing narrative voice
Builder path selector	A 3-question diagnostic at the top recommends Core/Pro/Max, then shows the matching card first.	Best if visitors are often unsure which plan fits
Technical spec sheet	Hero + cards, then a highly legible feature matrix written like product documentation with hover definitions/tooltips.	Best for highly technical/builder audiences
Enterprise split-path	Self-serve pricing for Core/Pro/Max on the left, separate right-side branch for teams, invoicing, onboarding, and launch priority.	Best if higher-value team/commercial accounts start appearing

Requestable visual assets

If this research is turned into design work, the highest-value assets to request are: a desktop and mobile high-fidelity mockup for the winning wireframe; a compact card component set; a proof/trust strip component; a progressive-disclosure comparison table; a sticky CTA state system; enterprise-CTA variants; a

microcopy library; and experiment-specific variant comps for tests one through four. That will let design and experimentation move in parallel rather than sequentially.

Three-month A/B test calendar

The best sequencing is to test one major pricing-page intervention at a time on all eligible pricing traffic, usually at a 50/50 split between control and treatment. A separate downstream onboarding or trial test can run later on post-click traffic if your tooling safely isolates it.

Window	Test	Traffic allocation	Notes
Month one, first half	Hero clarity + bundle explainer	100% eligible pricing traffic, 50/50 split	Highest-confidence lift; fixes first-order ambiguity
Month one, second half	Billing toggle position + annual total framing	100% eligible pricing traffic, 50/50 split	Watch annual share and overall starts
Month two, first half	Pro recommendation label + card emphasis	100% eligible pricing traffic, 50/50 split	Replace unsupported popularity language
Month two, second half	Remove duplicate sections	100% eligible pricing traffic, 50/50 split	Primary goal: shorter path to signup
Month three, first half	Add proof + trust strip	100% eligible pricing traffic, 50/50 split	Best after messaging is already clear
Month three, second half	Trial framing or entry model	100% eligible post-click traffic, 50/50 split	Run downstream to avoid contaminating page test results

If traffic is very low, collapse the program into fewer, larger tests and use the most proximal valid metric first, such as pricing-page CTA click or signup start. If traffic is high, keep the sequence but add pre-registered stop rules and a small quality holdout only if your experimentation framework supports it cleanly.

Open questions and limitations

This report is high-confidence on pricing-page psychology, trust, and UX structure, but a few points remain inherently uncertain without your internal data. I do not have ProjectCreation’s actual pricing-page baseline metrics, acquisition mix, device split, or trial-to-paid numbers, so the sample-size estimates are assumption-based. Some subscription findings I cited come from app-subscription datasets rather than pure B2B SaaS, so I treated them as directional rather than deterministic. Finally, I reviewed official live pricing pages and

your supplied ProjectCreation screenshots; I did not embed every third-party screenshot here because that would make the report unwieldy, but all live examples are linked through official citations. ¹³
